

We are against shoplifting

Invisible Detection Systems

The Invisible Detection System is the ultimate for your store's interior design. It is the choice of many high-end apparel merchants, as the discreetness of the detection system doesn't interfere with the visual appearance of the doorway. The compact detection system is actually built into the door frame, eliminating the need for exposed hardware

Sky Guard 3 and Gen 4

Sky Guard 3 with its active turbo antennas is the best solution if a customer wants to have high class security but a fully invisible or very discrete tagging system. This is the ideal detection solution for a wide doorway. The flexible transmission loop and the perfect noise cancellation of active Turbo antennas enable a trained WG partner to build a system with best detection but nothing interferes with the great store architecture.

Sky Guard is also very successfully used in Self Service environments, often built into the frames of automatic sliding doors.

Being best for the store architecture is not the only advantage of Sky Guard.—An invisible system, also can not be damaged by shopping carts, and does not narrow the entrance.

As Sky Guard is installed at the very end of the store, Sky Guard often also solves the problem of tagged merchandise being too close to the system.

Robust set of Features

- o DSP electronics for optimum performance.
Single loop cable eliminates mixing and matching cables.
- o Active turbo antennas with improved noise reduction algorithms.
Each turbo antenna can be tuned separately Anti-Jamming feature for added protection in GEN 4
Transmitter can be installed in plastic, wood, aluminum or stainless steel.
- o Gen 4 also has all tuning features of the AD Guard family, including Resonator or Ferrite optimization and the ability to run active turbo antennas in 4 independent channels.
